Increase door security and eliminate the endless costs of re-keying and replacing cylinders.

For high-end campus security, the Salto Virtual Network (patent pending) provides a unique combination of on-line "Hotspot" locks and off-line electronic locks. The system is linked together by the users' *intelligent* RFID key cards which are 2-way data transporters. In addition, you can instantly add or remove access rights across your entire campus for any staff, students, contractors and guests without the hassle or the risk of trying to determine who has keys. Think about the convenience. **Never worry about lost keys or unauthorized access by former employees/students again.**

- **Manage** access rights by user, to an entire network of keyless door locks from a central computer.
- **Monitor** who has entered/exited every locked doorway, at what time, on which date (audit trail).
- **Cancel** lost key cards with the click of a button.
- **Eliminate** material and labor costs of installing electrical wiring/network cabling to every doorway or a Wi-Fi backbone.
- **Prevent** the need to walk/travel from door to door to update access rights or perform lock diagnostics.

Affordable enough to replace every keyed lock at your school or campus - not just outside entrances.
